How can we help your users find more relevant results?

EBSCO

Relevance

Article Title

Subject Headings

Author Keyword

Abstracts
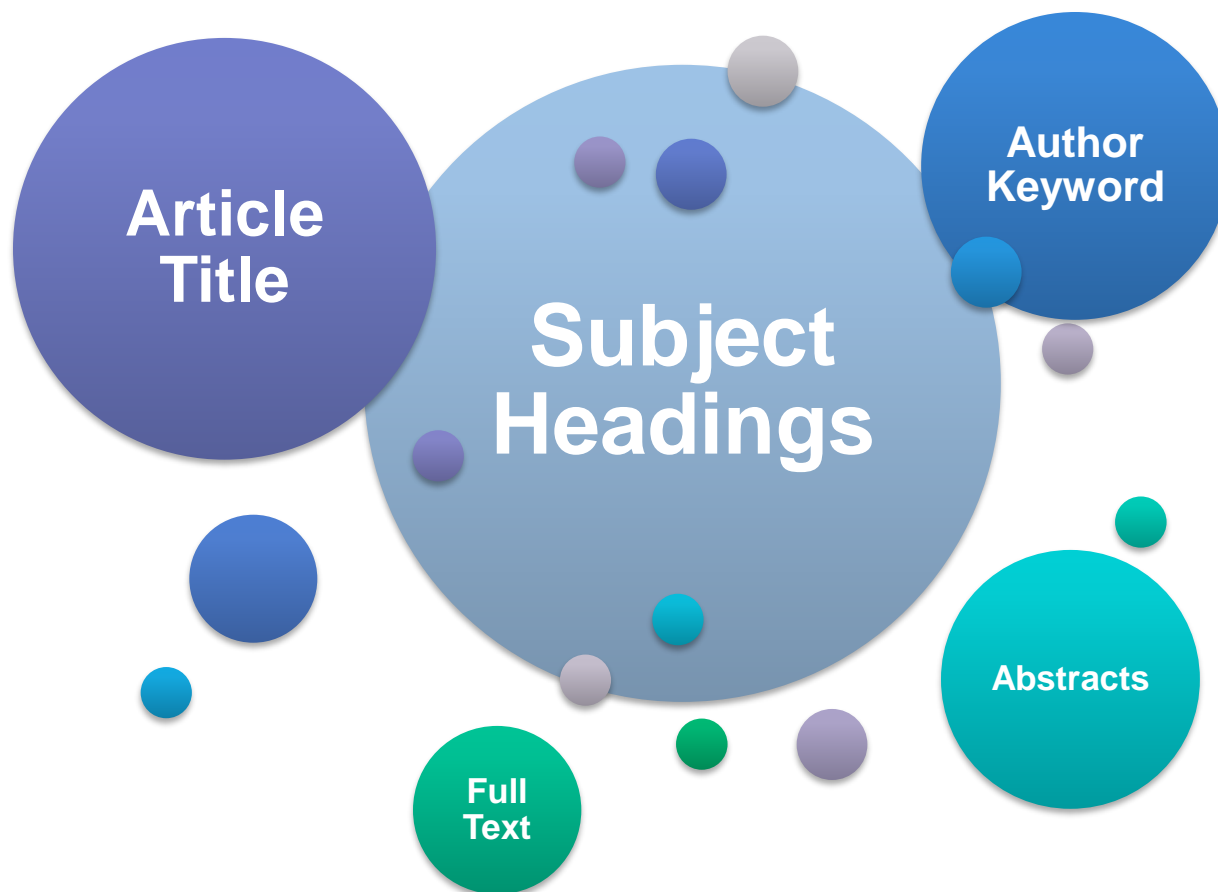

Full Text

Exact Matches: Exact matches are favored over partial matches – considering also the field in which those words appear (abstract vs. full text vs. title, etc.)

Density: Matches across multiple metadata fields are favored for relevance scoring (more is better). The scoring influence of repeat terms within individual metadata fields is minimized.

EBSCO

Enhanced Subject Precision

Topical Search Dominates

Topical search dominance applies to all markets/searches
Legend: ■ Topical/Exploratory ■ Known-item ■ Names ■ Other/Ambiguous

Categories: Medical, Academic, Public, Schools

THERAPEUTIC use
PHYSIOLOGICAL aspects
MINERALS -- Therapeutic use

Abstract: **Attention**-deficit/hyperactivity disorder (ADHD) is a chronic psychiatric illness, which often co-occurs with other common psychiatric problems. Although empirical evidence supports the short-term efficacy of pharmacological and behavioural treatments, families often search for alternative treatment methods because of concerns about side effects and safety, cost and access, as well as fears about long-term exposure to psychotropic medications. This review presents the published evidence on

EIS has major investment in sourcing and storing subject terms for content.
Subject indexing a strength for both EBSCO content and key content partners.

EBSCO

Problem: Missed Connections

Topical Query	Subject Indexing in EDS
adhd	Attention-deficit hyperactivity disorder Attention deficit disorder with hyperactivity
atarax	Hydroxyzine (Drug) Hydroxyzine
tumors	Tumours Neoplasms Neoplasms, cystic, mucinous, and serous
PET scan	Positron Emission Tomography Tomography, Emission-Computed Emission Tomography

User queries and subject indexing not always aligned.

Different vocabularies often use different terminology for the same concept.

Antiviral drug types

Listen ▶ ■ American Accent ⬍ ⚙ ⬇ «

Definition

Antiviral drugs are medications used to prevent the replication of viruses in the cells of the human body during infection.

400 mg tablets of the antiviral drug acyclovir (aciclovir). public domain via wikimedia commons

HIV and AIDS Medications

Antivirals targeted at the human immunodeficiency virus (HIV) make up more than one-half of the available antivirals. These antivirals can be divided into six subclasses: nucleoside reverse transcriptase inhibitors (NRTIs), non-nucleoside reverse transcriptase inhibitors (NNRTIs), protease inhibitors (PIs), integrase strand transfer inhibitors (INSTIs), CCR5 antagonists, and fusion inhibitors. Each class targets a different HIV enzyme or receptor.

Nucleoside reverse transcriptase inhibitors. NRTIs are competitive substrate inhibitors that complete with naturally occurring deoxynucleotides. NRTIs inhibit the enzyme, reverse transcriptase, thereby blocking the transcription of viral ribonucleic acid (RNA) to host deoxyribonucleic acid (DNA), preventing HIV from replicating, and preventing incorporation into the host genome. Available NRTIs include zidovudine, didanosine, stavudine, lamivudine, abacavir, and emtricitabine.

Non-nucleoside reverse transcriptase inhibitors. NNRTIs prevent viral RNA from being converted into DNA through the inhibition of reverse transcriptase. Available NNRTIs include efavirenz, nevirapine, delavirdine, and etravirine.

Protease inhibitors. HIV protease is an enzyme that exerts its effect after HIV has successfully entered the host cell and been incorporated into the host genome. Protease is responsible for breaking large protein strands called polyproteins into smaller viral particles, which then mature and become infectious to the host. Protease inhibitors prevent this cleaving of polyproteins and, therefore, prevent HIV particles from maturing and replicating. Available protease inhibitors include atazanavir, darunavir, fosamprenavir, indinavir, lopinavir/ritonavir, nelfinavir mesylate, ritonavir, saquinavir, and tipranavir.

Integrase strand transfer inhibitors . Integrase is an enzyme that facilitates insertion of viral HIV DNA into the host cell DNA. By inhibiting incorporation of the viral DNA, there is no formation of the provirus and, therefore, no viral reproduction within the host. The only available ISTI is raltegravir.

CCR5 antagonists . CCR5, along with CXCR4, is an important coreceptor facilitating the entry of HIV into the host cells. CCR5 antagonists inhibit CCR5, changing the conformation of the coreceptor and, therefore, preventing fusion of the host cell membrane and HIV. The only available CCR5 antagonist is maraviroc.

Fusion inhibitors . Fusion inhibitors bind to the viral envelope glycoprotein and block the conformational change that, if carried out, would result in the fusion on the HIV viral and host cell membrane. The only available fusion inhibitor is enfurvirtide.
